

AN ANALYSIS OF THE EURUSD CRASH AND HOW WE CALLED IT TO WITHIN A FEW TICKS

EURUSD TIME AND PRICE COME TOGETHER - OPPORTUNITY?

The chart on the right is depicting the Cash Euro against the US Dollar EURUSD.

For those you who are not technical traders we have marked on two price levels. The red lines divide the all time high in July 2008 with the subsequent all time low in June 2010. The 50% resistance level is at 139.58.

The second set of lines in green divide the most recent major high and low. The fibonacci .618 level which approximates to Gann's 5/8th point is at 138.35.

Most importantly the PFO is indicating a major cycle turn coming up ahead. It looks like the trend could be about to change. The pattern is that of a rising wedge which is also

bearish. You would need to have confirmation by whatever tools you deploy, but this set up may provide you with substantial opportunity.

Seasoned FX traders could trade spot currency, futures traders have the 6E contract and of course there are a variety of different ETFs.

Whats the fundamental story? Who knows? It is more than likely that the Crimean situation will escalate. Europe is beholden to this region for energy supplies. That is just one scenario. Ultimately it doesn't matter. The time is in. The price is in. Await confirmation and make your move.

In our pilot edition of what is now 'The Market Timing Report' we gave our readers the exact day of the high of the EURUSD market. Not only that we also gave you the price too! In fact we were so confident of the forthcoming event that we flew out from England to the USA for an emergency secret meeting. It took place on Good Friday 2014. Four people were at that meeting including one of the greatest names in the financial industry. They came in on the holiday especially to hear what we had to say. This is what we showed them.

In truth, forecasting isn't quite so simple as shown above.

Here is a full breakdown of how The Market Timing Report made this super accurate call and the several hundred other calls including the collapse of oil and subsequent low, the major trend changes in the Dollar Index as well as the major turns in grain markets to name a few.

The Market Timing Report scans markets in different time frames looking for different cycles to come together.

If one set come together then a minor turn can be forecast. However the real benefit of the system comes from when several cycle sets come together - THEN WE CAN EXPECT THE BIG ONE! A significant change in trend.

An easy way to explain this is as follows.

Firstly we look at the super macro picture.

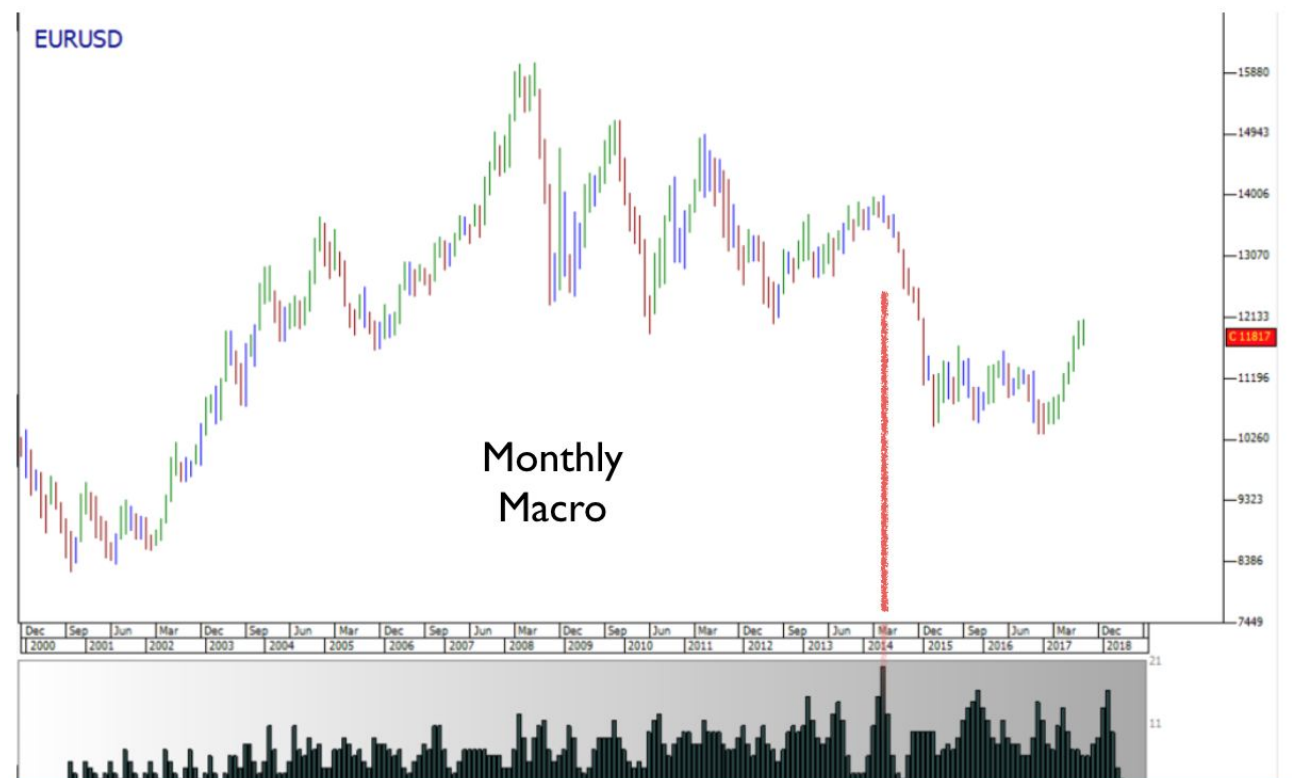

"The further back we look, the further forward we can see". The legendary statesman Sir Winston Churchill said that referring to history. This is also very true for markets.

Lets begin with a monthly chart.

In the chart below. you can see the largest histogram spike to date shown under the red line.

A spike of this size indicates a very high probability of a trend change.

Then we look at the medium term cycles and for ease of explanation we classify these into weekly cycles.

Here you can see another red line coinciding with another tall spike in histogram in this cycle set. This helps us identify the week within or near the month making this whole cycle set doubly strong already.

Then we can zoom into the daily cycles as shown below.

And here we can see a really tall histogram into top of the three rows. This is the day when a trend change is most likely to occurand sure enough - it was the exact day of the high!

So how do you use this? How do we benefit from this?

Well it's quite clear.

The cycle sets put us on alert as we enter the time window.

As the very first picture - the excerpt from the pilot MTR shows - we were at a double fibonacci level. In fact closer examination of the chart shows that we have been at this level for several months. Traders without timing information were losing their shirts as they kept trying to short the market and kept getting stopped out. They were too early.

How different would their situation have been if they knew about timing?

And now...

We're seeing the Next Major Turning Point In S&P 500!

Can you afford to ignore this information?

Are you ready to take advantage of this next upcoming cycle?
